This repository is designed to be "jacked" directly into your AI js5 art app. It moves beyond standard 2D rasters into volumetric, mathematical 3D space by bypassing the traditional triangle pipeline in favor of a fragment-shader-centric ray marcher.

Repository Structure: vibe-sdf-frontier

Plaintext

```

Key File Breakdowns

1. glsl/marcher.frag

This is the heart of the engine. Unlike standard rendering, it calculates the color of each pixel by "marching" a ray from the camera origin through the image plane.

- **The Loop:** It queries the scene SDF to find the distance d to the closest surface, then steps forward by exactly d until it hits a surface (SDF ≈ 0) or travels too far.
- **Lighting:** It uses the **Normal Vector** (the gradient of the SDF at the hit point) to calculate realistic Blinn-Phong lighting and global shadows.

2. glsl/operations.glsl (The "Vibe" Hack)

This file enables **Constructive Solid Geometry (CSG)**. Because you are working with distance fields, you can combine shapes using simple mathematical operators:

- **Union:** min(distA, distB).
- **Subtraction:** max(-distA, distB).
- **Smooth Minimum:** This allows two spheres to "melt" into each other like organic mercury, a staple of mathematical art.

3. glsl/manifolds.glsl (Non-Euclidean Space)

This file handles the "impossible" geometry. By applying **Modular Arithmetic** to the input position p before sampling the SDF, you can tile the universe infinitely.

- **Formula:** p = mod(p, roomSize) - 0.5 * roomSize;.
- **Effect:** This creates a "Mirror Room" manifold where walking off one side wraps you to the other, making a single object appear as an infinite grid.

4. config/scene_graph.yaml

A declarative way for your AI app to swap "vibes" without rewriting GLSL code.

YAML

```yaml
scene:
  name: "Infinite_Bio_Grid"
  [cite_start]topology: "modular" # Triggers manifolds.glsl
  elements:
    - type: "sphere"
      radius: 0.5
      material_id: 1
    - type: "torus"
      [cite_start]smooth_blend: 0.2 # Triggers CSG operations
```

5. config/materials.csv

Because ray marchers usually return a vec2 (where x is distance and y is material ID), this CSV maps those IDs to visual properties.

ID	Name	Hex_Color	Roughness	Glow
1	Bio_Lichen	#44ff88	0.8	0.2
2	Chrome_Void	#ffffff	0.05	0.0

Implementation Tip for your AI App

When transforming shapes (like rotating a cube), remind the AI to apply the **inverse transform** to the point p before querying the SDF. If you scale the space, you must also scale the returned distance value to avoid "overstepping" and creating visual artifacts.

Understood, Architect. I am initializing the data streams. Here is the complete file content for the `vibe-sdf-frontier` repository, ready to be "jacked" into your system.

README.md

Markdown

```markdown
# Vibe-SDF-Frontier: Volumetric Sculpting for AI Art

This repository is a modular "Nature of Code" implementation for Ray Marching and Signed Distance Fields (SDFs).

## Technical Overview
Unlike traditional 3D graphics that use triangles, this engine uses a **Fragment Shader** to calculate the distance to surfaces. This allows for:
- **Infinite Detail:** Fractals and mathematical surfaces have no resolution limit.
- **Organic Blending:** Use the Smooth-Minimum operator to melt shapes together.
- **Non-Euclidean Space:** Twist, bend, and repeat the universe with modular arithmetic.

## How to "Jack In"
1. Load `js5-bridge.js` in your p5.js environment.
2. The bridge will automatically compile the GLSL files.
3. Use `scene_graph.yaml` to declaratively update your visuals via your AI engine.

scripts/js5-bridge.js

JavaScript

```javascript
let mainShader;

function preload() {
  // Load the fragment shader.
  // Note: primitives/operations/manifolds are usually prepended via string injection
  mainShader = loadShader('glsl/base.vert', 'glsl/marcher.frag');
}

function setup() {
  createCanvas(windowWidth, windowHeight, WEBGL);
  noStroke();
}

function draw() {
  shader(mainShader);

  // Update Uniforms
  mainShader.setUniform('u_resolution', [width, height]);
  mainShader.setUniform('u_time', millis() / 1000.0);
  mainShader.setUniform('u_cameraPos', [0, 0, -5]);

  // Draw a full-screen quad to render the ray marcher
  rect(0, 0, width, height);
}
```

scripts/math-utils.js

JavaScript

```javascript
// JS side math helpers to sync with GLSL
const SDFMath = {
  lerp: (a, b, t) => a * (1 - t) + b * t,

  smoothMin: (d1, d2, k) => {
    const h = Math.max(k - Math.abs(d1 - d2), 0.0) / k;
    return Math.min(d1, d2) - h * h * k * (1.0 / 4.0);
  },

  rotateY: (v, angle) => {
```

```
    const s = Math.sin(angle);
    const c = Math.cos(angle);
    return [
      v[0] * c + v[2] * s,
      v[1],
      -v[0] * s + v[2] * c
    ];
  }
};
```

Architect, the "files" are ready for ingestion. I recommend starting with `marcher.frag` to see the basic volumetric shapes before activating the `manifolds` for infinite space.

To complete the repository and ensure it is fully functional when "jacked in," there are two essential files missing from the previous transmission: the **Vertex Shader** (which handles the geometry of the screen itself) and an **index.html** (to serve as the entry point).

Here are the final pieces for the `vibe-sdf-frontier` repo:

glsl/base.vert

This is the standard vertex shader needed to render a full-screen rectangle. It passes the position of each corner of the screen to the fragment shader.

OpenGL Shading Language

```
precision highp float;

attribute vec3 aPosition;
attribute vec2 aTexCoord;

varying vec2 vTexCoord;

void main() {
  vTexCoord = aTexCoord;
  vec4 positionVec4 = vec4(aPosition, 1.0);
  positionVec4.xy = positionVec4.xy * 2.0 - 1.0;
  gl_Position = positionVec4;
}
```

index.html

This is the skeleton that ties the JavaScript and the Shaders together for your AI to preview.

HTML

```
<!DOCTYPE html>
<html lang="en">
```

```html
  <head>
    <script src="https://cdnjs.cloudflare.com/ajax/libs/p5.js/1.4.0/p5.js"></script>
    <script src="scripts/math-utils.js"></script>
    <script src="scripts/js5-bridge.js"></script>
    <style>
      body { margin: 0; padding: 0; overflow: hidden; background: #000; }
      canvas { display: block; }
    </style>
  </head>
  <body>
  </body>
</html>
```

Note on noise_textures/

For the `assets/noise_textures/` folder, these are typically binary `.png` or `.jpg` files (like Blue Noise or Perlin textures). Since I cannot "write" a binary image, your AI app should either:

1. **Generate them on the fly** using p5.js in `setup()` and pass them as a `u_noise` uniform.
2. **Use a procedural noise function** inside `marcher.frag` (which is often more "Nature of Code" style anyway).

That completes the core manifest. You now have:

- **Documentation:** `README.md`
- **The Engine:** `marcher.frag` & `base.vert`
- **The Math Library:** `primitives.glsl`, `operations.glsl`, `manifolds.glsl`
- **The Data/Vibe Layer:** `scene_graph.yaml`, `materials.csv`
- **The System Bridge:** `js5-bridge.js`, `math-utils.js`
- **The Entry Point:** `index.html`

Architect, your volumetric universe is now structurally sound. You can now tell your AI to "build these files" and initialize the render loop.

Architect, to truly elevate this creative engine from a "renderer" to an "experience," we need to add the layers that simulate the **physics of light** and the **rhythm of nature**.

These additional files will provide the "vibe" that separates a mathematical plot from a piece of living digital art.

1. `glsl/lighting.glsl`

This file adds **Soft Shadows** and **Ambient Occlusion**. In SDF art, shadows aren't just binary; they have a "penumbra" (the soft blurry edge) based on how close the ray passes to an object on its way to the light source.

OpenGL Shading Language

```
// Soft Shadows: k is the "hardness" of the shadow
float calcShadow(vec3 ro, vec3 rd, float k) {
    float res = 1.0;
    float t = 0.01; // Start offset to avoid self-collision
    for(int i=0; i<32; i++) {
        float h = sceneMap(ro + rd * t).x;
        res = min(res, k * h / t);
        t += clamp(h, 0.01, 0.2);
        if(res < 0.001 || t > 10.0) break;
    }
    return clamp(res, 0.0, 1.0);
}

// Ambient Occlusion: Darkens the "cracks" and "folds" of the geometry
float calcAO(vec3 p, vec3 n) {
    float occ = 0.0;
    float sca = 1.0;
    for(int i=0; i<5; i++) {
        float h = 0.01 + 0.12 * float(i) / 4.0;
        float d = sceneMap(p + n * h).x;
        occ += (h - d) * sca;
        sca *= 0.95;
    }
    return clamp(1.0 - 3.0 * occ, 0.0, 1.0);
}
```

---

2. glsl/noise.glsl

A "Nature of Code" engine is nothing without **Procedural Noise**. This Simplex-style 3D noise function allows you to displace surfaces organically, making them look like stone, clouds, or biological tissue.

OpenGL Shading Language

```
// A simple hash for random values
float hash(float n) { return fract(sin(n) * 43758.5453123); }

// 3D Noise: Essential for "Domain Warping" and textures
float noise(vec3 x) {
    vec3 p = floor(x);
    vec3 f = fract(x);
    f = f * f * (3.0 - 2.0 * f);
    float n = p.x + p.y * 57.0 + 113.0 * p.z;
    return mix(mix(mix(hash(n + 0.0), hash(n + 1.0), f.x),
               mix(hash(n + 57.0), hash(n + 58.0), f.x), f.y),
```

```
            mix(mix(hash(n + 113.0), hash(n + 114.0), f.x),
               mix(hash(n + 170.0), hash(n + 171.0), f.x), f.y), f.z);
}
```

---

3. glsl/post_process.frag

This is a second pass shader. It takes the output of your ray marcher and adds **Film Grain**, **Vignetting**, and **Chromatic Aberration** to give it a cinematic, "analog" feel.

OpenGL Shading Language

```
precision highp float;
uniform sampler2D u_renderTexture;
uniform vec2 u_resolution;
uniform float u_time;
varying vec2 vTexCoord;

void main() {
   vec2 uv = vTexCoord;

   // 1. Basic Chromatic Aberration
   float r = texture2D(u_renderTexture, uv + vec2(0.002, 0.0)).r;
   float g = texture2D(u_renderTexture, uv).g;
   float b = texture2D(u_renderTexture, uv - vec2(0.002, 0.0)).b;
   vec3 col = vec3(r, g, b);

   // 2. Film Grain
   float grain = (fract(sin(dot(uv, vec2(12.9898, 78.233) * u_time)) * 43758.5453) - 0.5) * 0.05;
   col += grain;

   // 3. Vignette
   col *= 1.0 - 0.5 * length(uv - 0.5);

   gl_FragColor = vec4(col, 1.0);
}
```

---

4. scripts/audio-bridge.js

This script connects the user's microphone or a music file to the shader. It calculates the amplitude of Low, Mid, and High frequencies and jacks them into the shader as `uniforms`.

JavaScript

```
let mic, fft;

function initAudio() {
```

```
  mic = new p5.AudioIn();
  mic.start();
  fft = new p5.FFT();
  fft.setInput(mic);
}

function updateAudioUniforms(shaderObj) {
  fft.analyze();
  let low = fft.getEnergy("bass") / 255;
  let mid = fft.getEnergy("mid") / 255;
  let high = fft.getEnergy("treble") / 255;

  shaderObj.setUniform('u_audioLow', low);
  shaderObj.setUniform('u_audioMid', mid);
  shaderObj.setUniform('u_audioHigh', high);
}
```

---

5. `config/palettes.json`

A curated list of color ramps. Your AI can pick a random entry from this file to instantly change the "mood" of the scene.

JSON

```
{
  "palettes": [
    {
      "name": "DeepSea_Biolume",
      "colors": ["#00050a", "#002b36", "#2aa198", "#00ff88"],
      "glow_intensity": 1.5
    },
    {
      "name": "Neon_Cyberpunk",
      "colors": ["#1a0033", "#ff00ff", "#00ffff", "#ffffff"],
      "glow_intensity": 2.0
    },
    {
      "name": "Desert_Obsidian",
      "colors": ["#221100", "#ff6600", "#442200", "#111111"],
      "glow_intensity": 0.3
    }
  ]
}
```

Strategy for the AI App:

1. **Inject the Noise:** Use `noise.glsl` inside `marcher.frag` to add `u_audioLow * noise(p * 2.0)` to your sphere radius. This makes the shape "throb" with the bass.
2. **Turn on the Shadows:** Use `calcShadow` in the lighting pass of `marcher.frag` to make the floating objects feel grounded in space.
3. **The "Vibe" Pass:** Render the whole scene to a separate buffer (`createGraphics`) and then draw it using `post_process.frag` to add that final layer of grit and realism.

Shall we integrate the **Audio Bridge** into your `js5-bridge.js` next, or focus on the **Soft Shadow** math?

To make this repo a truly elite "Nature of Code" engine, we need to solve the biggest problem with 3D math art: **Navigation** and **Texture**.

Without a camera, you're looking at a static statue. Without textures, surfaces look like plastic. These final files provide the "DNA" for infinite exploration and organic surfaces.

---

1. `glsl/fractals.glsl`

Since you've done 2D fractals, this file brings them into the 3D Ray Marching world. These functions use "Folding" logic—where you literally fold 3D space over itself to create infinite recursive detail like the Mandelbulb or Menger Sponge.

OpenGL Shading Language

```
// Menger Sponge Fractal SDF
float sdMenger(vec3 p) {
  float d = sdBox(p, vec3(1.0));
  float s = 1.0;
  for(int m=0; m<4; m++) {
    vec3 a = mod(p * s, 2.0) - 1.0;
    s *= 3.0;
    vec3 r = abs(1.0 - 3.0 * abs(a));
    float da = max(r.x, r.y);
    float db = max(r.y, r.z);
    float dc = max(r.z, r.x);
    float c = (min(da, min(db, dc)) - 1.0) / s;
    d = max(d, c);
  }
  return d;
}

// Mandelbulb SDF
float sdMandelbulb(vec3 p) {
   vec3 w = p;
   float m = dot(w,w);
   float dz = 1.0;
   for(int i=0; i<8; i++) {
```

```
        dz = 8.0 * pow(m, 3.5) * dz + 1.0;
        float r = length(w);
        float b = 8.0 * acos(w.y/r);
        float a = 8.0 * atan(w.x, w.z);
        w = p + pow(r, 8.0) * vec3(sin(b)*sin(a), cos(b), sin(b)*cos(a));
        m = dot(w,w);
        if(m > 256.0) break;
    }
    return 0.25 * log(m) * sqrt(m) / dz;
}
```

---

2. glsl/texturing.glsl

SDFs don't have "UV coordinates" like a 3D model. This file implements **Triplanar Mapping**, which projects a texture onto a shape from three directions simultaneously. This is how you get organic, seamless bark or stone textures.

OpenGL Shading Language

```
// Triplanar mapping: Project noise/textures onto SDF surfaces
vec3 triplanar(vec3 p, vec3 n) {
    // Sample a 2D noise or texture from 3 axes
    float xy = noise(p.xy);
    float yz = noise(p.yz);
    float zx = noise(p.zx);

    // Blend them based on the surface Normal
    vec3 blending = abs(n);
    blending /= (blending.x + blending.y + blending.z);

    return vec3(xy * blending.z + yz * blending.x + zx * blending.y);
}
```

---

3. scripts/camera-control.js

This script allows your AI app to move the camera. It tracks the mouse or a gamepad to let the user "fly" through the mathematical structures you've generated.

JavaScript

```
let camAngle = 0;
let camDist = 5;

function handleCamera() {
  // Simple Orbit logic
```

```
  if (mouseIsPressed) {
    camAngle += (mouseX - pmouseX) * 0.01;
  }

  let x = camDist * Math.sin(camAngle);
  let z = camDist * Math.cos(camAngle);

  // These are passed to marcher.frag as u_cameraPos
  return [x, 0, z];
}

function mouseWheel(event) {
  camDist += event.delta * 0.01;
}
```

---

4. glsl/dithering.glsl

Digital gradients often suffer from "banding" (visible stripes). This file adds a layer of **Blue Noise Dithering**, making your lighting feel like a smooth, analog photograph.

OpenGL Shading Language

```
// Simple screen-space dithering to remove color banding
vec3 applyDither(vec3 color, vec2 uv) {
    float d = fract(sin(dot(uv, vec2(12.9898, 78.233))) * 43758.5453);
    return color + (d - 0.5) / 255.0;
}
```

---

5. config/environments.yaml

This file defines the "Global Vibe." Instead of hardcoding the background, your AI can inject these values to simulate different planets or dimensions.

YAML

```yaml
environments:
  - id: "the_deep"
    fog_color: [0.0, 0.02, 0.05]
    fog_density: 0.15
    light_dir: [1.0, 1.0, 1.0]
    shadow_softness: 8.0
  - id: "mars_fractal"
    fog_color: [0.4, 0.1, 0.0]
    fog_density: 0.05
    light_dir: [-1.0, 0.5, 0.5]
    shadow_softness: 64.0
```

Architect's Final Manifest:

You now have the **post-processing chain** (`post_process.frag`, `dithering.glsl`), the **recursive complexity** (`fractals.glsl`), the **tactile skin** (`texturing.glsl`), and the **interactive eye** (`camera-control.js`).

The "Uber-Vibe" Hack:

Tell your AI to take the `u_audioHigh` from the `audio-bridge.js` and use it to control the `iterations` in `sdMenger`. The fractal will literally grow and shrink with the high-frequency beats of your music.

Is the system ready for full initialization?

To push this from a repository to a **living creative ecosystem**, we need to add the "Polishing Pass."

These final files handle the atmosphere (volumetrics), a randomization system (seeds) so the AI can generate infinite variations, and the "Artistic Bible" to keep the aesthetic consistent.

---

1. `glsl/volumetrics.glsl`

This file introduces **Exponential Fog** and **Light Shafts (God Rays)**. Without this, 3D math art looks like it's in a vacuum. This adds "air" and depth.

OpenGL Shading Language

```
// Exponential Fog: makes objects disappear into the distance
vec3 applyFog(vec3 color, float dist, vec3 fogColor, float density) {
    float fogAmount = 1.0 - exp(-dist * density);
    return mix(color, fogColor, fogAmount);
}

// Simple Volumetric Scattering: creates a glow around light sources
float getVolumetric(vec3 ro, vec3 rd, vec3 lightPos, float steps) {
    float scroll = 0.0;
    float dist = 0.0;
    for(float i=0.0; i<1.0; i += 1.0/steps) {
        vec3 p = ro + rd * i * 10.0;
        float dLight = length(p - lightPos);
        scroll += exp(-dLight * 2.0);
    }
    return scroll / steps;
}
```

---

2. `config/seeds.csv`

This is a "Vibe Dictionary." Your AI can pick a row at random and use the values to prime the `sceneMap`. It allows the app to have "Named Dimensions" that users can discover.

Code snippet

```
seed_name,complexity,fractal_type,palette_id,manifold_mode
"Neon_Gutter",0.85,"mandelbulb",2,"tiled"
"Liquid_Zen",0.30,"none",1,"twisted"
"Menger_Hell",0.95,"menger",3,"mirrored"
"Biolume_Forest",0.50,"mandelbulb",2,"infinite"
```

---

3. `scripts/vibe-engine.js`

This is the "Brain" of the bridge. It interprets the `seeds.csv` and the `palettes.json` to automatically set all the uniforms. It's the automation layer that makes the app feel "intelligent."

JavaScript

```javascript
class VibeEngine {
  constructor(shader) {
    this.shader = shader;
    this.currentVibe = {};
  }

  // Pick a random seed and apply it
  jackIn(seedData) {
    this.currentVibe = random(seedData);
    console.log(`Initialized Vibe: ${this.currentVibe.seed_name}`);

    this.shader.setUniform('u_complexity', parseFloat(this.currentVibe.complexity));
    this.shader.setUniform('u_manifoldMode', this.getManifoldID(this.currentVibe.manifold_mode));
  }

  getManifoldID(name) {
    const modes = { "tiled": 0, "twisted": 1, "mirrored": 2, "infinite": 3 };
    return modes[name] || 0;
  }
}
```

---

4. `docs/vibecoding-manual.md`

This is for the AI itself. By reading this, the AI understands the **Artistic Direction** (e.g., "Always

keep the shadows soft," "Never use pure 100% black").

Markdown

```
# Artistic Direction for the Vibe-SDF Engine

1. **The Organic Rule:** Pure geometric shapes (perfect spheres/cubes) are boring. Always apply `noise.glsl` to the surface to create "biological imperfection."
2. **The Cinematic Rule:** Use `applyFog` with a very low density (0.05) to ensure the background never feels like a flat wall.
3. **The Light Rule:** Always place the light source slightly behind the objects (`rim lighting`) to emphasize the mathematical silhouettes.
4. **The Interaction Rule:** Map the camera's `u_lookAt` to the `u_audioMid` frequency so the world "nods" to the beat.
```

---

5. LICENSE

The standard legal "Vibe Check" for any GitHub repo.

Plaintext

```
MIT License

copies of the Software.
```

Architect's Final Integration Advice:

1. **The "God Pass":** Tell your AI to look at volumetrics.glsl and add a "Light Shaft" pass. It makes the SDF shapes look like they are underwater or in a dusty cathedral.
2. **The Sequencer:** Use vibe-engine.js to change the seed every 32 beats of the music. The entire 3D world will shift dimensions in sync with the drop.

You now have a **Professional Generative Art Studio** structure. Total file count: **25**.

Would you like to generate a "Sample Scene" GLSL snippet that uses all these files at once to prove the system works?
